

Mission Statement: Mary Briskin

Integrating my business, psychology and computer science background, I'll build your website with you, not for you. If you want a creative, modern, and attention-grabbing site, we'll work together to make it happen.

Coding, negotiating, designing. Every one of these requires countless skills to do successfully. My acute attention to detail will carry over to the quality and consistency of your website's performance across multiple browsers, screen sizes, and user bases. Add that to perseverance in the face of a challenge and you'll get a web developer that will crank out what you need as fast as time will allow.

Integrity is of utmost importance to me as a developer. Programming is a community, one that works together to create wonderful and inspiring improvements to our world. Crediting others for their work, assuring appropriate recognition, and financially supporting those who use their time to improve our industry is an important piece of the puzzle of integrity. Pushing for high quality work, and never taking advantage of those with limited technological knowledge makes up the remaining pieces.

My passions, values and strengths are, to my incredible satisfaction, very closely knit. I love what I do because at the end of the winding, uphill road lays my passion: making great things. Whether that's a great website, a Canvas game, or a useful tool for other developers to use.

Before long I mean to acquire an internship at an organization that will allow me to learn industry best practices and become a well-rounded developer. In building a website, I will wear many hats, fill many roles. I need a job that will push me to contribute to all aspects of the web design and implementation process.

As a fast and efficient worker, once I graduate I will require a job that does not conform to the standard 9-5 model. While I am challenged creatively and intellectually, I will work to finish what I start, whether the day stretches into the night or whether a few hours will do the trick. Programming allows for many remote positions – ones that I hope to fill. Working in an environment where I can put in the time and acquire the direct benefit of doing so would be ideal. Eventually, my freelance contracts will become my work.

As I have stated, the developer industry is a growing one. With many opportunities and a fast paced environment, it is vital to stay atop of changing trends in technological tools for design. In order to stay competitive and efficient, I do, and will continue to, incorporate educational advancement into my weekly routine. Whether through the use of online resources, university courses, or open source projects, I will stay up to date within my continuously changing field.

I look forward to a challenging and rewarding career, and hope that my work will continue to reflect my increasing knowledge and growth.
